Scholarship essay

Tania Rahman · Fully funded PhD · Sample draft, 300 words

My thesis showed that a hospital can train a useful eye-screening model with only a few hundred labelled images. In Bangladesh, where specialists are few and clinics are far apart, that matters. During my PhD I will make such models stay reliable across clinics, and I will release open benchmarks so that other small groups can test their own. After the award I plan to build a lab-to-clinic partnership at home, using what I learn, and to train students in careful, reproducible methods.

NOTES ON THE DRAFT

- One story with a result: a useful model from only a few hundred labelled images.
- A clear plan for the PhD and for the years after the award.
- Tied to the funder's goal of lasting benefit, in her own words.
